

Abstract

An ornamental cover (3) having easily deformable narrow spoke portions (20) for partially covering a disk radial portion (7) along wheel radius direction is attached from outside to a wheel base unit (2) so as to constitute a design surface with the outside surfaces of the easily deformable narrow spoke portions (20) and the exposed outside surface of the disk radial portion (7). This permits the easily deformable narrow spoke portions (20) to follow the deformation of the disk radial portion (7). Therefore, it is possible to reduce noise produced with external forces received when driving and provide excellent low noise characteristic. Furthermore, design surface constituted by the merger of the easily deformable narrow spoke portions (20) and the exposed outside surface of the disk radial portion (7) displays unprecedented design characteristic. Thus, the vehicle wheel (1) displays both excellent low noise characteristic and superb design characteristic.
